A: Follow the steps as mentioned below: Remove the ink cartridge from the printer's ink port Close the door at the ink port to prevent ink leakage Remove the ink port cover and the toner cartridge Remove the PC board and replace with a fresh one I hope it'll help. This application relates generally to the field of bedding and mattresses and more specifically to the field of mattresses having springs and support mechanisms. A number of different mechanisms and systems have been proposed for supporting a person on a bed. For instance, some bedding and mattresses are provided with threaded bolt-type latches that secure the mattress to the support rails at multiple locations. However, because of the high loads involved, it is generally necessary to embed a

single threaded bolt within a through bore of the support rail in order to prevent loosening of the latch. In other mattresses, a number of threaded dowels are threaded into the support rails and a mattress surrounds the support rails to secure the mattress to the rails. However, because the dowels are threaded into the rails, they can only take up a limited amount of material, and thus the support rail must have a sufficient wall thickness to accommodate the dowels. In still other mattresses, a number of stringers are secured to a support rail and a mattress surrounds the support rails to secure the mattress to the rails. However, in order to secure the mattress to the stringers, multiple fastening mechanisms must be threaded through the stringers. Furthermore, if dowels are used to secure the mattress to the rails, the mattress cannot be directly supported on the rail. In other bedding and mattresses, steel springs are secured to a wood-based bed frame, which is usually provided

with a cushioning pad on which the mattress is placed. The steel springs provide a generally uniform support throughout the mattress, but the wood can be expensive. Although some bedding and mattresses are provided with mattresses attached to a mechanism that is rigidly attached to the support rail, such as a rod, which is anchored to the bed frame, most beds are provided with a mechanism that has a soft, resilient support that simulates the contour of the body. Because of the soft nature of the support, it is easy for the support mechanism to sag, resulting in a poor quality sleeping surface.
