Another program that should be considered is GIMP (Open Source Graphics Editor), which is free and very accessible. It shares a similar interface to Photoshop, but is much simpler to use. There are plenty of online tutorials and training courses to help you get comfortable with GIMP, which you can find at 'www.gimp.org'. An easy way to get started with Photoshop is to create a document in the normal, double-page setting. To do this, create a new document on the first page of the printer with the standard Photoshop interface. Then click the Blank Document icon (labelled in the margin) and choose the Normal double-page option from the drop-down menu. After choosing Normal double-page, Photoshop opens an empty document on the second page. It works the same way in the other programs. The file size of a document can be reduced using the following two commands: 'Image=>Resize=>Crop' 'Image=>Resize=>Fit' These commands allow you to resize a document or image with a rectangular crop in a single click. This is handy when a document or image needs to fit within a specific space. You can save your crop by pressing Enter. Now, you can zoom out on the page and pan around in the document as desired. Open a second blank document if you wish to make changes to the main document. Don't worry if your document isn't perfect; you can press Ctrl+Z (#+Z) to undo any changes you've made, or Ctrl+X to cut it out of the document. After you are happy with the result, you can save the document or image, replace the previous one by right-clicking over the image and choosing Replace Image, and then press Enter to save the changes to the previous document. You can use the following shortcut keys to make changes to a document or image, as shown in the figure: 'Ctrl+Z (#+Z)' Undo the last change you made in the document or image. 'Ctrl+Y (#+Y)' Redo the last change you made in the document or image. 'Ctrl+Delete (#+Delete)' Cut the current image or document out of the document. 'Ctrl+C (#+C)

Freezing selected areas You can use the Freeze option to save a pixel area so it cannot be moved. If you have created some text but not saved it, just freeze the text area by following these steps: 1. **Double-click the text tool to bring up the Options bar.** You can also access this tool by pressing T on the keyboard. 2. **Click the Freeze Text option, as shown in **Figure 3-5**** 3. **Click an area of the document in which you want the text to remain frozen.** The text remains in its original position unless you change it, of course. **FIGURE 3-5:** The text is frozen so it can't be moved. Freezing selected areas can be quite handy. A car may need to stay in the same place on a speed bump. A frame may need to be frozen to keep the image from rotating around the text. In the following dialog box, you can also freeze the selection as well as the path on which it was aligned.
